Which pests are causing you problems?

Cockroaches

Cockroaches are one of the world's most revolting creatures. Hygiene conscious people are repulsed by their habits of regurgitating and defecating on foodstuffs, dishes and cutlery. Whether they are American, German or Australian cockroaches, disease and sickness is a bi-product of their presence in man's environment.

American Cockroaches

Large (35-40mm) reddish brown with a pale indistinct border around the pronotum. The wings completely cover the abdomen. They prefer damp areas, basements, drains, sewers and grease traps, but will also infect dry areas. This species can travel long distances for food. 15-20 nymphs per egg capsule hatch in 4-6 weeks.

German Cockroaches

Small (10-15mm) light brown with 2 darker stripes over their pronotum. Newly hatched nymphs are the size of a pinhead. The female is often observed carrying an egg capsule from which 30-40 nymphs hatch. A single female produces approximately 250 young and this can multiply to over 200,000 in 3 generations - they are often found in washrooms, food storage and preparation areas where warm, moist conditions exist.

Australian Cockroaches

Large - dark brown in colour with a pale stripe on each wing and a distinct shield on the pronotum. They infest mainly dry areas such as wall or ceiling voids etc. 15-20 nymphs hatch from each egg capsule.

Rodents

Rats and mice are highly destructive pests and cause significant damage to packaging and foodstuffs as well as defecating upon products on which they are feeding. Mice have 5-8 litters per year and 5-6 young per litter. Rats have 4-6 litters and 5-10 young per litter.

Spiders

Spiders such as the Funnel Web and Redback are dangerous to humans and can cause sickness and in extreme cases - death. Others are simply of nuisance value. Unsightly webbing and marking of building surfaces leads to continual cleaning to maintain an acceptable appearance. Webbing spiders are a problem both internally and externally.

Ants

Two species of ants constitute the majority of ant problems. The Coastal Brown Ant is a ground dwelling species which tracks into buildings in search of food. The Black Ant will regularly nest in walls and ceilings. Specialised treatment is required and species identification as well as location of the source is imperative for effective control measures.

Stored product pests

Pests such as weevils, flour beetles and tropical warehouse moths are a major problem in many businesses. Damage is generally caused by the larval stage which can often be found in sealed packages, contaminating the product and rendering it unsaleable.

Uncontrolled Pests: What is Your Real Cost?

1 Health Problems

Salmonella, Dysentery, Diarrhoea & Stomach Upsets, are all ailments which can be transmitted by pests. These and other sicknesses can affect your customers and staff.

2 Work Place Disruption

Many species of pests cause rashes, bites, itches and sores. These can cause severe discomfort in the work environment.

3 Dissatisfied customers

When pest problems exist, it could cost you your good public image. Customers expect to be served in safe, hygienic surroundings and demand to be supplied with uncontaminated products.

4 Health Authority Intervention

Establishments where pests are not controlled are constantly in danger of Health Authority Intervention which could lead to temporary closure.

The Benefits of Choosing Our Service

You No Longer Have To Worry

Your pest problem becomes our responsibility. New and existing customers receive the same prompt and reliable service. We view any call for assistance from our customers as a matter of urgency. Our response is prompt.

You can have confidence in the success of our treatment

Effective treatments requires professional equipment. Each Amalgamated vehicle carries the latest specialised equipment designed and manufactured to enable our operators to achieve precise delivery of product right to the target sites. We don't just offer a 'quick spray' but a thorough treatment.

We provide an atmosphere free of pests while respecting the fragile nature of our environment.

Our technical development department carries out constant research into methods of treatment, product application and equipment development. Always our focus is to provide our customers with an atmosphere free from the dangers of pest species harmful to humans while respecting the fragile nature of our environment. Constant research helps us to achieve our goal of being guardians of the environment.

Why Choose Amalgamated Pest Control?

- With over 80 years of industry experience we can provide the solutions to your pest management challenges.
- Our customers come first - We provide prompt service. While the others are arranging, we're doing.
- After-sales service is a priority. Once a treatment is completed, we stand by our work with a free service warranty backup. Should the need arise, a prompt on-call service applies for the entire warranty period.
- Our field technicians carry the latest specialised equipment designed to achieve the safest and most effective application possible. Our treatment methods have proved to be the most successful control measures available.
- We are a quality assured company to ISO 9001:2000.
- We are comprehensively insured for your peace of mind.
- An Amalgamated Pest Control Management Program means more than just applying pesticides. We have field supervisors and national technical support available for expert advice on pests and pest management.
- The pesticides used are environmentally friendly and the safest available. Continual testing and research ensures that the latest developments are implemented with your interests in mind.
- We have extensive industry involvement at all levels, and active working relationships with our industry association (AEPMA), State and Federal Government bodies covering Health, WorkCover, Forestry, Primary Industries and Employment and Training.
- We can provide your complete pest management solution.

Our services include:

- o All general household and commercial pests including rodents
- o Mosquito and biting Midge Management
- o Termites and other timber pests
- o Bird and fly management
- o Specialist compliance in HACCP and AQIS systems
